

Lever Hoist/Operating Instructions //

The **Lever Hoist** normally comes in the following Safe Working Loads: 750kgs, 1500kgs, 3000kgs and 6000kgs, and is a piece of manual handling equipment that is similar to a chain block but has an operation controlled by a lever, which is normally 3-positional, i.e.: 'Up' – 'Neutral' and 'Down'.

Operation //

Ensure that the load to be lifted is within the parameters of the Safe Working Load of the lever Hoist and that the lever Hoist is attached to a suitable connection if a lifting operation is to be carried out. Ensure that any slings attached to the bottom hook of the Lever Hoist are attached in such a manner that the safety-catch can be returned to the closed position without being trapped by the slinging process.

Caution //

When using this equipment, which is normally a low-level operation, make sure that the return of the chain on the dead-end is not trapped or hindered in any way.

FULL LOAD CONDITIONS.

Only allow a Chain Sling to be used by a person competent and trained in the use of such items.

H.O.L	1.5M, 3M, 6M
S.W.L	750kgs, 1.5T, 3T, 6T
